

# Provoking the Opposition

---

Korhan Koçak

April 21, 2020

Princeton University

# Congress is becoming more ideologically polarized

1. Extremists **replacing** moderates

Thomsen (2014, 2017) and Hall (2019)

2. Incumbents **becoming more extreme**

McCarty, Poole, and Rosenthal (2016), Bonica (2014)

Mixed evidence of a corresponding increase in **mass polarization**

Fiorina, Abrams, and Pope (2008), Bafumi and Herron (2010), Barberá (2015), Ahler and Broockman (2018)

Electoral **penalty** for extremism

Canes-Wrone, Brady, and Cogan (2002) and Hall (2015)

3. Penalty is diminishing, but **only** for incumbents

Bonica and Cox (2018) and Tausanovitch and Warshaw (2018)

A mechanism that explains 1., 2., and 3. **without** a polarizing electorate

Extremist incumbents face extremist **challengers**

- Extremist incumbents **embolden** opposition party's base who field challengers who are more **congruent**

# Trade-off between electability and congruence

Primary voters care about policies **and** probability of winning

Coleman (1971), Aronson and Ordeshook (1972), Abramowitz (1989), Abramson et al. (1992), Owen and Grofman (2006), Rickershauser and Aldrich (2007), Serra (2011), and Woon (2018)

Incumbents' **influence on selection of candidates** in opposition party

Means

Choose policies to manipulate this trade-off and **provoke opposition extremists**

Motivation

More likely to beat an **extremist challenger**

Reid/Angle

McCaskill/Akin

Can incumbents **provoke** extremists to win primaries?

And thus **improve their reelection chances?**

## Key Takeaway

Incumbent can increase her probability of reelection by moving **away** from center

Downs (1957), Wittman (1983), and Calvert (1985)

Two mechanisms:

1. Primary elections
2. Candidate entry

Provoking the opposition can **only** happen when

1. General and primary electorates are **divergent**

Brady, Han, and Pope (2007), Fiorina, Abrams, and Pope (2010), King, Orlando, and Sparks (2016), and Hill and Tausanovitch (2018)

2. Parties are **constrained** in their choice of candidates

Banks and Kiewiet (1989), Steger (2000), Mattozzi and Merlo (2008), Thomsen (2014), Hassell (2015), Dal Bó et al. (2017), Thomsen (2017), and Hall (2019)

# Democrats are constrained to a few candidates for 2020

# Choices with and without electability concerns diverge

## Horse Race Choice vs. Magic Wand Choice

Avalanche Strategy, May 30-June 3, 1109 likely Democratic voters

1. Primitives
2. Primary elections
  - Endogenous primaries, exogenous set of candidates
3. Endogenous entry
  - Exogenous primaries, endogenous set of candidates
4. Combined model
  - Endogenous primaries and endogenous set of candidates
5. Discussion

# Primitives

---

# Primitives

Citizens with ideal points  $v \in \mathbb{R}$ , median voter's ideal point is 0

Two parties on either side of median

Loss from policy:  $-\ell(|v - x|)$ , increasing and convex

e.g.  $|v - x|$ ,  $(v - x)^2$ ,  $e^{|v-x|}$ , ...

Global utility shock for incumbent, drawn from log-concave density  $f$ , cdf  $F$

e.g. uniform, normal, exponential, ...

Incumbent's ideal policy is  $t$ , cares about her platform and office rents  $B$

$$\Pr(\text{reelection})(B - \ell(|t - x_I|))$$

Majority rule

1. Incumbent chooses her platform  $x_I > 0$
2. Challenger  $x \leq 0$  is selected
3. Utility shock revealed
4. General election takes place
5. Winner implements their platform in the second period

SPNEq in undominated strategies

# Analysis

---

Median voter votes for challenger with probability

Why?

$$F(\ell(|x_I|) - \ell(|x|))$$

Two candidates, single-peaked preferences  $\implies$  median voter is **decisive**

Pins down the probability any challenger would beat incumbent

## Primary Election

---

# Primary election

Primary voter's net gain:

$$\underbrace{F(\ell(x_I) - \ell(-x))}_{\text{Probability of beating incumbent}} \times \underbrace{(\ell(|x_I - v|) - \ell(|x - v|))}_{\text{Payoff gain from beating incumbent}}$$

When  $x$  closer to zero, candidates are **more electable** but **less congruent**

## Proposition 1

*When the marginal loss function satisfies log-concavity, the median primary voter's optimal candidate wins the primary.*

# Open nominations

Suppose opposition is **unconstrained** in their challenger choice

$$\max_{x \in \mathbb{R}} F(\ell(x_I) - \ell(-x))(\ell(|x_I - v_p|) - \ell(|x - v_p|))$$

Against a more extreme incumbent:

- Improve **both** probability and policy gain
- Challenger's ideology may be more or less extreme
- But **not so extreme to lose more often**

## Proposition 2

*When the opposition party is unconstrained in the ideology of the challenger, they defeat a more extreme incumbent with a higher probability.*

Two primary candidates with platforms  $x_E < x_M$

$$\max_{x \in \{x_E, x_M\}} F(\ell(x_I) - \ell(-x))(\ell(|x_I - v_p|) - \ell(|x - v_p|))$$

When median primary voter **closer** to  $E$ , but  $M$  **much more electable**,  
there exists an incumbent platform  $\tilde{x}_I$  such that

Conditions

- When incumbent is more moderate,  $M$  wins primary
- When incumbent is more extreme,  $E$  wins primary

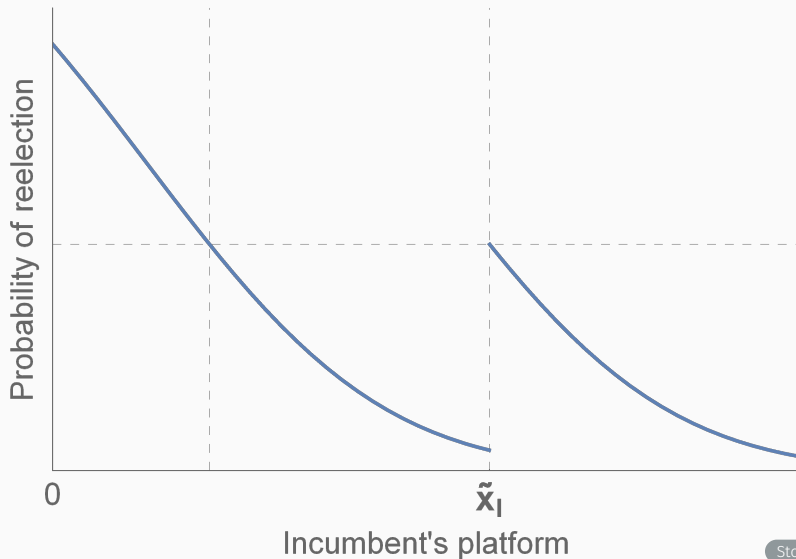

Lemma

Incumbent can improve her reelection probability by moving right

Incumbent can improve her reelection probability by moving right

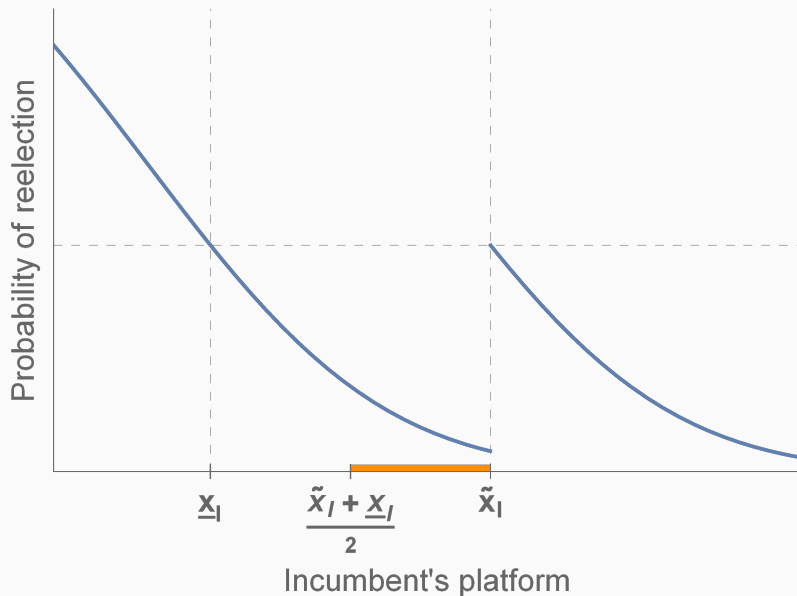

Incumbent *will* improve her reelection probability by moving right

### Proposition 3

*When the incumbent's ideal point  $t$  is more moderate than but sufficiently close to  $\tilde{x}_I$ , and office rents  $B$  lie in an intermediate range, the incumbent provokes the opposition by choosing  $\tilde{x}_I > t$ .*

Incumbent *will* improve her reelection probability by moving right

## Endogenous Entry

---

## Endogenous entry

$E$  and  $M$  care about policy, cost of running, office rent

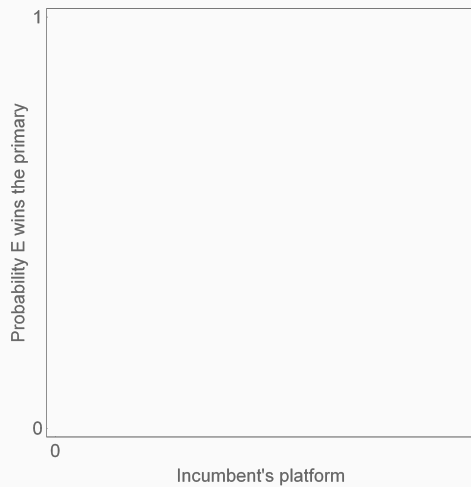

Sequential announcements

Probability extremist wins primary,  $p$ , given exogenously

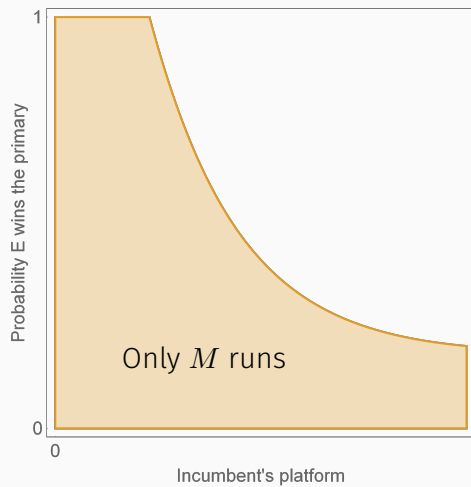

$E$ 's net payoff from running, when  $M$  is running

$$-c + p \left[ \overbrace{F(\ell(x_I) - \ell(-x_E))(B + \ell(x_I - x_E))}^{E \text{ more likely to win}} \right. \\ \left. \underbrace{-F(\ell(x_I) - \ell(-x_M))(\ell(x_I - x_E) - \ell(x_M - x_E))}_{M \text{ less likely to win}} \right]$$

# Who wants to run?

# Who wants to run?

# Who wants to run?

# Who wants to run?

# Who wants to run?

Values

$E$  and  $M$  close

$E$  first

Simultaneous

No rent

No cost

Quadratic

Uniform

When there is a primary advantage for extremists ( $p$  high)  
or no primary advantage for either candidate ( $p$  close to  $1/2$ ),  
there exists an incumbent platform  $\tilde{x}'_I(p)$  such that

Conditions

- $E$  enters if and only if incumbent is more extreme than  $\tilde{x}'_I(p)$

Proposition

## Even primary field

Values

$E$  and  $M$  close

$E$  first

Simultaneous

No rent

No cost

Quadratic

Uniform

## Incumbent improves reelection chances by inducing $E$ 's entry

# Primary advantage for extremist

Values

$E$  and  $M$  close

$E$  first

Simultaneous

No rent

No cost

Quadratic

Uniform

## Incumbent improves reelection chances by inducing $E$ 's entry

### Proposition 5

*When there is a primary advantage for extremists or no primary advantage for either side, the incumbent's ideal point is more moderate than but sufficiently close to  $\tilde{x}'_I(p)$ , and office rents  $B$  lie in an intermediate range, the incumbent provokes the opposition by choosing  $\tilde{x}'_I(p) > t$ .*

## Combined Model

---

## Endogenous candidate entry with primary elections

Primary voters vote for a candidate in the race

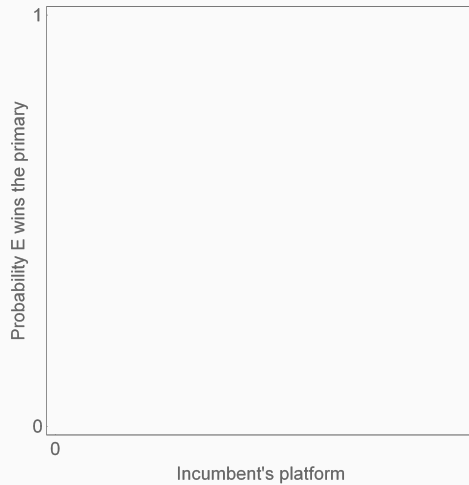

Recall that the median primary voter is decisive

$E$  and  $M$  announce their candidacies accordingly, sequentially

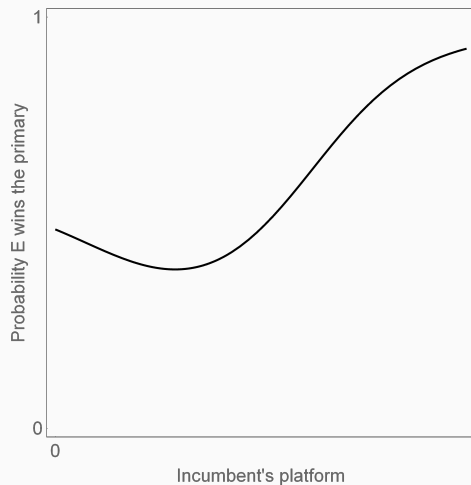

Suppose primary voters also receive a stochastic shock

- Independent from the general election shock

## Probability $E$ wins primary depends on incumbent's platform

## Probability $E$ wins primary depends on incumbent's platform

$$v_p < x_E < x_M$$

# Probability $E$ wins primary depends on incumbent's platform

Quadratic loss

$$v_p < x_E < x_M$$

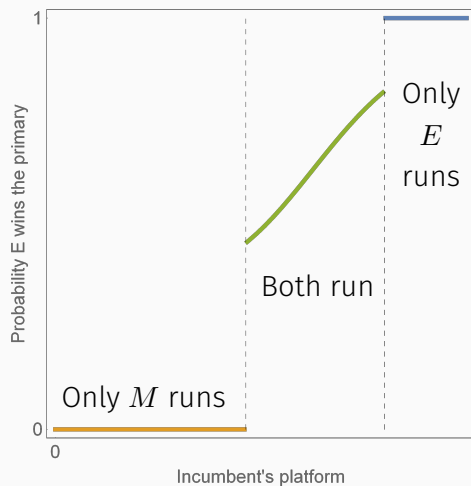

# Who enters depends on the incumbent's platform

Quadratic loss

$$v_p < x_E < x_M$$

## Who wins the primary depends on the incumbent's platform

$$v_p < x_E < x_M$$

## Who wins the primary depends on the incumbent's platform

$$x_E < v_p < \frac{x_E + x_M}{2} < x_M$$

# Who wins the primary depends on the incumbent's platform

$$x_E < \frac{x_E + x_M}{2} < v_p < x_M$$

## Discussion

---

# Provoking the opposition can only happen when

General and primary election voters are far apart

*“divergence of primary from general electorates is six times larger in 2012 than in 1958”*

Hill and Tausanovitch (2018)

Parties are constrained in their choice of candidates

Party control decreasing

John W. Davis

*“In 1968, 57 percent of all Democratic delegates were chosen through devices that were essentially party-based; by 1980, none were.”*

Shafer (2014, p. 89)

*“Primary voters’ choices are constrained to the extent that money, organization, and media attention concentrate”*

Steger (2000)

## Conclusion

---

# Provoking the Opposition

Incumbent hurts her appeal to the median voter

Embolden the opposition party, especially extremists

Extremists run/win more in primaries

Incumbent is reelected more often

Only possible if

- Primary and general electorate are far
- Parties are constrained in choice set

Thank you

Daily Kos

It's time for us to take an active role in the GOP nomination process. That's right, it's time for those of us who live in open primary and caucus states—**Michigan, North Dakota, Vermont and Tennessee** in the next three weeks—to head out and cast a vote for Rick Santorum.

Keep the clownshow going

Democrats: extend the GOP presidential race by voting for Rick Santorum in the Michigan open primary. Because it would be hilarious.

### Operation Chaos [\[ edit \]](#)

In late February 2008, Limbaugh announced "Operation Chaos," a political call to action with the initial plan to have voters of the [Republican Party](#) temporarily [cross over to vote](#) in the [Democratic](#) primary and vote for [Hillary Clinton](#), who at the time was in the midst of losing eleven straight primary contests to [Barack Obama](#).<sup>[123]</sup> Limbaugh has also cited the [open primary](#) process in the early primary states of [New Hampshire](#) and [South Carolina](#), which allowed independent voters to cross over into the Republican primaries to choose John McCain over more conservative candidates (such as [Fred Thompson](#)), as an inspiration.<sup>[124]</sup>

At the point in which Limbaugh announced his gambit, Obama had seemed on the verge of clinching the Democratic nomination.<sup>[125]</sup> However, Clinton subsequently won the [Ohio](#) primary and the [Texas](#) primary (while losing the Texas caucus and the overall delegate split) with large pluralities from rural counties; thus reemerging as a competitive opponent in the race.<sup>[126]</sup>

## Conditions for the existence and uniqueness of $\tilde{x}_I$

Existence:

$$\ell(x_M - v_p) > \ell(|v_p - x_E|) \quad \text{and} \quad \frac{F(-\ell(-x_M))}{F(-\ell(-x_E))} > \frac{\ell(-v_p) - \ell(|x_E - v_p|)}{\ell(-v_p) - \ell(x_M - v_p)}.$$

Uniqueness:

$$(\ell(x_I - v_p) - \ell(x_I - x_M)) \frac{\ell'(x_I)}{\ell'(x_I - v_p)} > \frac{(F(x_I, x_M) - F(x_I, x_E))F(x_I, x_E)}{F(x_I, x_M)f(x_I, x_E) - F(x_I, x_E)f(x_I, x_M)}.$$

## Conditions for the existence and uniqueness of $\tilde{x}'_I$

Existence:

$$\frac{F(-\ell(-x_M))}{F(-\ell(-x_E))} > \frac{\ell(-x_E) + B}{\ell(-x_E) - \ell(x_M - x_E)}.$$

Uniqueness:

$$(\ell(x_I - x_E) - \ell(x_I - x_M)) \frac{\ell'(x_I)}{\ell'(x_I - x_E)} > \frac{(F(x_I, x_M) - F(x_I, x_E))F(x_I, x_E)}{F(x_I, x_M)f(x_I, x_E) - F(x_I, x_E)f(x_I, x_M)}.$$

## $E$ runs first

# Multiple equilibria when candidates announce simultaneously

# Who wants to run?

$$F \sim \mathcal{N}(0, 1)$$

$$\ell = |v - x|$$

$$\text{cost} = 0.5$$

$$\text{rent} = 2$$

$$x_E = -1.2$$

$$x_M = -0.5$$

## $E$ advantage in primaries, and $E$ runs first

# Optimal candidates when losses are linear or exponential

For citizens $v$ in	Their optimal candidate is
$v < x^*$	$x^*$
$v \geq x^*$	$v$

## Probability $E$ wins primary depends on incumbent's platform

$$v_p = -2 < x_E = -1.2 < x_M = -0.5$$

$$c = 0.5, B = 2$$

## Probability $E$ wins primary depends on incumbent's platform

$$x_E = -1.2 < v_p = -1 < x_M = -0.5$$

$$c = 0.5, B = 2$$

## Probability $E$ wins primary depends on incumbent's platform

$$x_E = -1.2 < v_p = -0.6 < x_M = -0.5$$

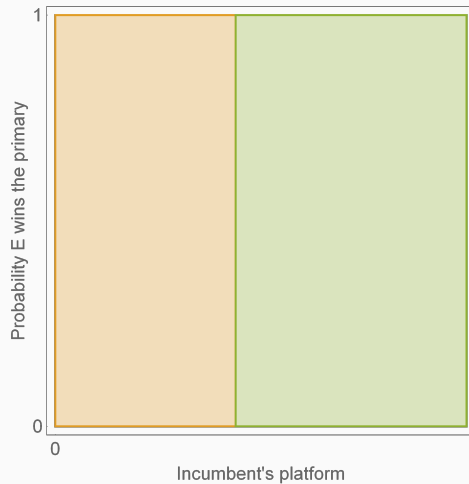

$$c = 0.5, B = 2$$

# No office rents

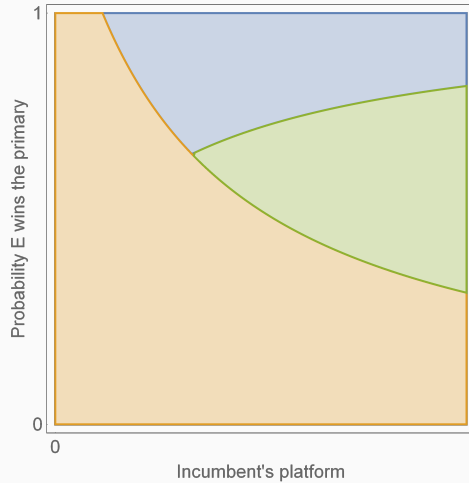

# No cost of running

# Candidates are ideologically very close

## Utility shock drawn from $\mathcal{U}(-2, 3)$

# Quadratic loss

# Quadratic loss

# Decline of party control on delegate selection

## More people rate Trump as conservative

## Presidents tend to move away from center for reelection

Year	Winner	Liberal	Moderate	Conservative	Net
1980	Ronald Reagan	17	15	50	+33
1984	Ronald Reagan	14	17	52	+38
1988	George H.W. Bush	7	26	50	+43
1992	Bill Clinton	38	37	13	-25
1996	Bill Clinton	45	37	10	-35
2000	George W. Bush	10	27	52	+42
2004	George W. Bush	8	16	66	+58
2008	Barack Obama	60	25	12	-48
2012	Barack Obama	60	22	12	-48
2016	Donald Trump	10	21	40	+30
2019	Donald Trump	8	14	50	+42

## 2010 Senate Election in NV: Harry Reid & Sharron Angle

Moderate Sue Lowden vs. Extremist Sharron Angle

In the last 10 polls before the primary

- Lowden led Reid by an average of 7.7 points
- Angle led Reid by an average of 3.6 points

Reid sidelined stronger opponents by intimidation and with attack ads

Angle won primary, lost general election

*“We clearly see his fingerprints and meddling throughout our Republican primary”*

*Lowden's campaign manager on Reid*

## 2012 Senate Election in MO: Claire McCaskill and Todd Akin

Frontrunner John Brunner, outsider Sarah Steelman, and extremist Todd Akin  
Brunner and Steelman both led McCaskill by  $\approx 9$  points, Akin by  $\approx 5$  points  
McCaskill decided she'd rather face Akin

- Ran dog-whistle ads calling Akin “too conservative”
- Unlike other Democrats from purple states, didn't distance from Obama

Akin won primary, lost general election

*“I had just made the biggest gamble of my political career—a \$1.7 million gamble—and it had paid off. Running for reelection to the U.S. Senate as a Democrat from Missouri, I had successfully manipulated the Republican primary so that in the general election I would face the candidate I was most likely to beat.”*

*McCaskill and Ganey, 2016*

## Democratic National Convention of 1924

William Gibbs McAdoo won 9/12 primaries, 60% of popular vote

Delegates not bound to vote in line with primary results

2/3 of delegates required for nomination

Supporters of McAdoo and Al Smith found each other unacceptable

After 102 deadlocked ballots, McAdoo and Smith dropped out

Compromised on dark horse candidate John W. Davis on 103rd

## Electoral penalty for extremism has been decreasing for incumbents

Bonica and Cox (2018) and Tausanovitch and Warshaw (2018) argue

- Voters are more party-centered, and thus less candidate-centered
- Individual members of congress can get away with extremism

Hall (2015) finds a penalty does exist for non-incumbents

- Stronger for candidates running against incumbents

My model suggests incumbents now can provoke the opposition

- Extreme incumbents face more extreme challengers
- Isolated from electoral penalty because challengers also more extreme

# Choices with and without electability concerns diverge

## Horse Race Choice vs. Magic Wand Choice

Avalanche Strategy, October 1-4, 1041 likely Democratic voters

# Decisiveness of the median primary voter

Centrists and extremists can unite against the median primary voter to field:

1. A centrist
2. An extremist (e.g. raiding)

Numerical example

Real-life example

Median primary voter is **not decisive** in general

Log-concavity of marginal loss **ensures decisiveness**

Back

## Log-concavity of the marginal loss

$$(\ell''(x))^2 \geq \ell'(x)\ell'''(x)$$

Ensures net payoff gain ratio is monotonic, i.e. for any  $x_2 > x_1 > x_0 > x_i$ :

$$\frac{d \frac{\ell(x_2 - x_i) - \ell(x_0 - x_i)}{\ell(x_2 - x_i) - \ell(x_1 - x_i)}}{dx_i} \leq 0.$$

cf. ratio dominance in Kartik, Lee, and Rappoport, 2019

# Probability of winning general election / Probability of winning primary election
